

Opportunity Scoring Engine

Multi-variable prioritization engine that synthesizes equity spread, authority certainty, distress indicators, and Deal Friction Scores (DFS) into an objective 0–100 ranking and actionable acquisition priority bands.

Strategic Moat: Balancing Equity Spread Against Execution Friction

High equity is completely deceptive if execution is blocked by severe title friction or court gridlock. A \$400k equity spread locked behind 6 fighting heirs and court-supervised confirmation is far less valuable than a \$100k equity spread held by a confirmed sole executor ready to sign today. OSE integrates the Deal Friction Score (DFS) directly with financial upside to determine true probability-adjusted deal velocity.

1. Master Scoring Formula & Friction Calibration

The composite Opportunity Score is calculated by evaluating gross opportunity upside across four core pillars, directly modified by the calibrated Deal Friction Score (DFS):

```
Gross Upside = (P1_Equity * 0.35) + (P2_Authority * 0.30) + (P3_Distress * 0.20) + (P4_Liquidity * 0.15)
```

```
Composite Score = Gross Upside - Deal Friction Score (DFS)
```

Where DFS (0 - 35 deduction points) is computed from:

- Ownership Complexity (from OIE): Score 10 - 100
- Control Complexity (from CIE): Single controller vs. multi-heir consensus
- Court Oversight Level (from ARE): Independent Admin (0 pts) vs. Dependent/Supervised (-15 pts)
- Title & Debt Risk: Unprobated deeds, tax deed threats, or clouds on title

2. The Deal Friction Score (DFS) Architecture

DFS aggregates outputs generated across OIE, CIE, and ARE into an objective friction penalty that prevents high-equity/high-friction traps:

Deal Friction Scoring Matrix:

- Low Friction (0 - 5 pts penalty): Single owner, sole executor, independent administration, clean deed chain. [Fastest closing path]
- Moderate Friction (10 - 15 pts penalty): Trust transfer requiring certificate, or uncontested petition awaiting hearing. [Standard timeline]
- High Friction (20 - 25 pts penalty): 3+ heirs in intestacy, dependent court confirmation of sale required, or back-tax auction risk.
- Extreme Friction (30+ pts penalty): Multi-generational unprobated estate, active will dispute/caveat, or unlocated beneficiaries.

Strategic Calibration Rule:

- High Equity + Low Friction = Priority A (Immediate blitz outreach; target close in 14-21 days)
- High Equity + Extreme Friction = Priority B or C (High value, but long gestation cycle; assigned to specialized title-cure reps)

3. Priority Bands & Operational Directives

Priority A (Score 80 - 100) — Immediate Execution

- Profile: High equity spread (>50%), confirmed authority or sole petitioner, Low Deal Friction (DFS ≤ 10), motivated absentee or vacant asset.
- Protocol: Rapid 24-hour multi-channel outreach. Priority alerts to partner acquisitions director.

Priority B (Score 60 - 79) — Core Production Queue

- Profile: Strong equity with Moderate Friction, or moderate equity with Low Friction. Viable pipeline opportunity.
- Protocol: Structured 3-week outreach sequence.

Priority C (Score 40 - 59) — Nurture & Milestone Watch

- Profile: High friction (contested claims, multiple heirs, dependent court supervision). Requires milestone resolution before contract readiness.
- Protocol: Monitored by court docket state machine; re-scored upon milestone trigger.

Disqualified (Score < 40 or Hard Flag) — Suppressed

- Profile: Non-buybox asset, negative equity, unresolvable title defect, or DNC flag.
- Protocol: Auto-suppressed. Never charged against partner monthly capacity.

4. Dynamic Event-Driven Re-Scoring Engine

Scores automatically update in real time when upstream docket or title milestones reduce Deal Friction:

- **Letters Issued:** Authority certainty jumps to 100 pts and DFS drops by 15 pts, instantly elevating high-equity Priority B/C files into Priority A.
- **Heir Renunciation / Joinder Filed:** Multi-heir complexity score is reduced in OIE, lowering DFS by 10 pts.
