

Executive System Architecture

Convert fragmented public records into evidence-backed, decision-maker-ready acquisition opportunities.

Category Definition: Acquisition Decision Intelligence (ADI)

Gieni is not a lead-generation company, a data broker, or a skip-tracing service. Gieni is an Acquisition Decision Intelligence platform. Legacy vendors sell spreadsheets of unstructured names scraped from courthouses. Gieni transforms fragmented, multi-jurisdiction public archives into deterministic ownership-control pathways and actionable, contract-ready acquisition packages.

The Strategic Foundation: Ownership ≠ Control ≠ Authority

Traditional probate lists fail because they conflate three entirely distinct legal and human dimensions into a single row:

- The Owner of record is dead (or a trust entity).
- The Control belongs to a family member, caretaker heir, or resident occupant.
- The Authority belongs to a court-appointed fiduciary granted statutory Letters.

Only when an intelligence platform systematically resolves all three layers does a raw public filing become a viable acquisition opportunity.

1. Problem Statement: Generational Transfer Friction

Generational property transfer represents one of the largest ownership transitions in modern real estate. The vast majority of this real estate passes through complex, highly frictional public bureaucracies: county probate dockets, deed registries, tax assessor offices, and municipal courts.

For professional real estate wholesalers, acquisitions teams, and institutional buyers, sourcing off-market transactions in this sector is plagued by extreme operational waste:

- **Information Fragmentation:** Courthouse dockets do not list property addresses; deed records do not reflect death events; assessor rolls do not reflect fiduciary appointments.
- **Wasted Outbound Marketing:** Over 85% of generic marketing touches target individuals who cannot legally sign a deed—such as unappointed petitioners, estranged heirs, or attorney gatekeepers.

- **Title Gridlock & Delay:** Deals collapse weeks into escrow due to unresearched encumbrances, court-supervised confirmation delays, or unlocated co-heirs.

2. Why Now?

The Timing Imperative

Court records are public.

Property records are public.

GIS records are public.

Tax records are public.

The information has always existed. What has changed is the ability to reconcile fragmented ownership, control, authority, and equity at scale through autonomous multi-agent reasoning and deterministic relational modeling.

3. The Gieni Core Intelligence Pipeline

4. The Five Intelligence Layers Explained

Layer 1: Property Intelligence (PIRE & PRE)

- Core Question: Which exact real estate parcel is tied to this proceeding?
- Mechanics: Resolves fuzzy name variations, multi-parcel estate holdings, contiguous tax parcel bundles, and situs vs. mailing address discrepancies.
- Proprietary Metric: Parcel Attribution Score (PAS, 0–100) combining source agreement, address correlation, and title continuity.

Layer 2: Ownership Intelligence (OIE Core & EIE)

- Core Question: Who owns the property and what encumbrances exist?
- Mechanics: Analyzes recorded conveyance deeds to verify vesting (Fee Simple, JTWROS, Living Trust, Tenancy in Common, Heir Property). Computes the Net Equity Waterfall auditing open mortgages, tax arrears, and statutory liens.
- Proprietary Metric: Ownership Complexity Score (10–100) & Net Equity Tier.

Layer 3: Control Intelligence (CIE)

- Core Question: Who drives the family decision to sell?
- Mechanics: Disentangles Ownership from Control. Identifies informal family leaders, resident caretaker heirs, and proxy controllers using occupancy, legal retainer sponsorship, and geographic proximity heuristics.
- Proprietary Output: Control Archetype (Unified, Informal Leader, Proxy, Trust Fiduciary, Contested).

Layer 4: Authority Intelligence (ARE)

- Core Question: Who holds the legal authority to sign the purchase agreement?
- Mechanics: Evaluates court dockets through a lifecycle state machine. Identifies Letters Testamentary / Administration, Independent Administration powers, and bypasses attorney gatekeepers to isolate direct fiduciary records.
- Proprietary Metric: Four-Tier Authority Classification (Confirmed, Likely Decision Maker, Stakeholder Requiring Verification, Unresolved).

Layer 5: Opportunity Intelligence (OSE)

Opportunity Intelligence converts ownership, control, authority, equity, and friction into a prioritized acquisition recommendation.

- Core Question: What is the probability-adjusted value and outreach priority?
- Mechanics: Calibrates gross equity upside against the Deal Friction Score (DFS). Distinguishes high-equity/low-friction quick closes from high-equity/extreme-friction legal traps.
- Proprietary Output: Composite Score (0–100), Priority Band (Priority A, B, C, Disqualified), and Dynamic Milestone Re-Scoring.

5. Why Probate is Only the First Vertical

Probate is the crucible of real estate title research. It represents the highest data friction, the most fragmented local court systems, and the most intricate legal rules in the property sector. If a platform can solve county-level probate data, it has solved the hardest data problem in real estate. The five-layer architecture of Gieni is completely asset-agnostic and transaction-agnostic.

6. Future Expansion Verticals

- **1. Trust Estate Dispositions:** Uncovering off-market trust-held properties, locating successor trustees, and facilitating private non-court liquidations.
- **2. Heir Property & Clouded Title:** Multi-generational unprobated properties, providing structured genealogical heir mapping and title cures.
- **3. Judicial Partition Actions:** Identifying fractured co-tenancies in active partition lawsuits, enabling investors to acquire fractional interests or broker unified buyouts prior to auction.
- **4. Guardianship & Conservatorship:** Navigating court-supervised liquidations for incapacitated estate owners requiring liquidity for skilled nursing care.
- **5. Tax Distress & Surplus Equity:** Intervening during statutory redemption windows to purchase high-equity distressed homes prior to tax foreclosure.

8. What Gieni Produces

Input → Platform → Output

- Inputs: Court Records, Property Records, Tax Records, GIS Records.
- The Core Output: Probate Opportunity File
 - Property Profile (APN, Situs Address, Legal Description, Condition Signals)
 - Ownership Profile (Title Vesting, Deed Chain, Encumbrances & Net Equity Waterfall)
 - Control Profile (De-Facto Decision-Maker, Heir Dynamic, Control Archetype)
 - Authority Profile (Letters Status, Statutory Powers Granted, Court Oversight Requirements)
 - Opportunity Profile (Viability Score 0–100, Priority A/B/C, Deal Friction Score)
 - Evidence Package (Verified Petitions, Deeds, Assessor Cards with SHA-256 Hashes)
 - Recommended Action Directive (First-touch empathy angles, negotiation posture, closing pathway)

Gieni converts fragmented public records into acquisition-ready decisions.
